Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Charging Pile competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. In 2024, global charging pile production reached 6709.78 K units approximately, with an average global market price of around US\$ 984 per unit. Charging piles function similarly to gas pumps at gas stations. They can be fixed to the ground or wall and installed in public buildings (such as public buildings, shopping malls, and public parking lots) and residential parking lots or charging stations. They can charge various models of electric vehicles at different voltage levels. The input of the charging pile is directly connected to the AC power grid, and the output is equipped with a charging plug for charging electric vehicles. Charging piles generally offer two charging methods: conventional charging and fast charging. Users use a special charging card to swipe the card through the human-machine interface provided by the charging pile to select the corresponding charging method, charging time, and cost information. The charging pile display can also display data such as charging level, cost, and charging time. Charging piles can be categorized by the output current they provide, including AC and DC charging piles. A key factor influencing the speed of electric vehicle adoption is the improved charging experience. The two most influential factors influencing this experience are ease of access to charging stations (charging piles) and charging speed. The trend toward higher voltages in electric vehicle electrical platforms is a current technological evolution trend among OEMs. This trend necessitates charging piles that can increase the upper charging voltage limit to 1000V to support the high-voltage models that will become common in the future. The primary challenge in achieving fast charging with charging piles is the thermal management challenges associated with high-power supercharging. Supercharging requires cables to withstand high currents of 400-600A, necessitating

rapid heat dissipation. Liquid-cooled terminals differ from conventional fast-charging terminals primarily in their cooling method for the charging cable. Conventional charging cables are air-cooled, resulting in limited cooling and a limited ability to withstand the heat generated by high currents, thus limiting charging power. Liquid-cooled charging cables, on the other hand, circulate coolant through internal and external cooling tubes to quickly dissipate heat generated by the cables, enabling them to withstand higher currents. Liquid-cooled terminals are lightweight, easy to use, and meet the demands of supercharging, making them a promising future trend. Currently, liquid-cooled guns haven't gained widespread adoption, resulting in low production volumes and high pricing. However, as downstream supercharging demand increases and liquid-cooled terminals become widely used, their costs and prices are expected to gradually decrease. The large-scale construction of charging infrastructure will inevitably have a significant impact on grid load. Using storage-charging modules can help smooth out peak loads and offset valleys, effectively alleviating pressure on the grid. These modules include V2G charging modules and single- and bidirectional DC-DC charging modules. V2G charging modules enable orderly interaction between new energy vehicles and the grid, actively promoting smart charging. Operators can use V2G charging modules to charge new energy vehicles and also send power back to the grid. Single- and bidirectional DC-DC charging modules can be used in integrated photovoltaic, storage, and charging scenarios. Through voltage regulation, they effectively transmit and convert DC power between photovoltaic panels, energy storage batteries, and new energy vehicles.

The global Charging Pile market size was estimated at USD 6602.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 15.50% during the forecast period.
