Report Overview

Heat shrink tubing is used to insulate wire providing abrasion resistance and environmental protection for the stranded solid wire conductors with connections, joints and terminals in electrical work. In general, a tube with a lower shrink temperature will shrink faster. When heat shrink tubing is wrapped around wire arrays and electrical components, it collapses radially to fit the contours of the equipment, forming a protective layer. It can protect against abrasion, low impact, cuts, moisture and dust by covering individual wires or encasing entire arrays. Plastic manufacturers begin by extruding a thermoplastic tube to create heat-shrink tubing
