Abstracts

An electric vehicle seat motor is a type of motor used in the power-adjustable seats of electric vehicles (EVs) and some hybrid vehicles. These motors provide the necessary power to move and adjust the position of the vehicle's seats, offering a range of adjustments to enhance comfort and ergonomics for the occupants. Electric seat motors have largely replaced manual seat adjustment mechanisms in modern vehicles, providing convenience and customization options for drivers and passengers. From the perspective of product type and technology, electric car seat motors can be divided into DC brushed motors and DC brushless motors. At present, there are many types of electric seat adjustment motors on the market, and they are basically dominated by brushed motors, accounting for about 93.59% of the market. Brushed motors have large size, low efficiency, high noise, short life, and the adjustment speed cannot be changed according to passenger requirements. The adjustment accuracy and memory position deviation are large, and the motor resonance is large. These problems have always been difficult to solve for electric seats in the existing market. In the context of global energy conservation and environmental protection, seat motors show two development trends. One is the miniaturization and lightweight of motors. The other is to replace brushed permanent magnet DC motors with brushless motors. Brushless motors have the characteristics of low noise and smaller size than brushed motors with the same power. The use of brushless motors in seat motors is the future development direction.

The global Electric Vehicle Seat Motor market size was estimated at USD 719.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 13.80% during the forecast period.
