Abstracts

The electric vibrating screen machine is a mechanical device that uses an electric drive device to generate vibration, and then screens and analyzes the material. Its core working principle is to drive the vibrator through the motor to generate exciting force, which acts on the screen body to make it vibrate with a certain frequency and amplitude. The material is subjected to the vibration force on the screen body, which will produce throwing, rolling, sliding and other movements, thereby realizing the screening and grading of the material. The electric vibrating screen machine is usually composed of a screen body, a vibrator, a motor, a base and a transmission device. The screen body is equipped with a screen, and the mesh size and material of the screen can be adjusted according to the different materials to be screened. The vibrator is a key component of the electric vibrating screen machine, and its performance and structure directly affect the screening effect.

The global Electric Vibrating Screen Machine market size was estimated at USD 2114.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 3.00% during the forecast period.
