### Report Overview:

Electrical discharge machining (EDM), also known as spark machining, spark eroding, burning, die sinking, wire burning or wire erosion, is a manufacturing process whereby a desired shape is obtained by using electrical discharges (sparks). Material is removed from the work piece by a series of rapidly recurring current discharges between two electrodes, separated by a dielectric liquid and subject to an electric voltage. One of the electrodes is called the tool-electrode, or simply the 'tool' or 'electrode,' while the other is called the workpiece-electrode, or 'work piece.' The process depends upon the tool and work piece not making actual contact.

The Global Electrical Discharge Machining (EDM) Market Size was estimated at USD 2331.51 million in 2023 and is projected to reach USD 3344.91 million by 2029, exhibiting a CAGR of 6.20% during the forecast period.
