Abstracts

Electrical silicon steel, also known as electrical steel or lamination steel, is a specialized ferromagnetic alloy characterized by high silicon content (typically 1?3.5%), which significantly enhances electrical resistivity and reduces eddy current losses, making it indispensable for energy-efficient electromagnetic applications. This material is produced in either grain-oriented (GO) or non-grain-oriented (NGO) forms, with GO offering superior magnetic properties in the rolling direction for transformers and NGO providing isotropic performance for rotating machinery like motors and generators. Its primary function is to serve as the core material in electrical equipment, where it minimizes hysteresis and eddy current losses, thereby improving energy conversion efficiency and reducing operational costs in power transmission and electromechanical systems.

The global Electrical Silicon Steel market size was estimated at USD 10250.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 5.50% during the forecast period.
