Abstracts

An electrically adjustable focus lens is a light-focusing medium that can dynamically adjust its focal length using input electrical energy. Based on an optical fluid and polymer film combination, the core element consists of a container filled with optical fluid and sealed with a thin elastic polymer film. When current or voltage is applied to the liquid lens cell, the cell's shape changes. This change occurs within a few milliseconds and results in a change in optical power, which results in a change in focal length and WD.

The global Electrically Adjustable Focus Lenses market size was estimated at USD 256.8 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 8.45% during the forecast period.
