Report Overview

Electrically conductive gaskets consist of a homogeneous dispersion of electrically conductive particles, process modifiers, and additives within an elastomer binder system. Traditional electrically conductive fillers include pure silver, silver-plated copper, silver-plated aluminum, silver-plated glass, and nickel-plated graphite. Silicone- and fluorosilicone-based resin systems are typically the material of choice primarily due to processability, excellent compression set performance across a wide temperature range, and the ability to compress at low closure forces. EPDM-based resin systems are generally used in applications exposed to harsh chemicals.
