#### Report Overview

Electrically powered steering column drive systems are the systems which require a column to support or connect the steering wheel to the system. Optimally the EPS drive is placed on the side of the steering column in the vehicle interior. An additional torque is provided by the motor and is transferred to the system. This method is used in compact vehicles which have to be built in a limited amount of space. These systems are fuel efficient, and hence they emit less carbon dioxide. The systems having column drive electrically powered steering system does not have to worry about the temperature ranges and have a beneficial effect on the cost of the system. The EPS column drive systems work like a normal EPS system where they monitor the driver's activity and assists only when its required, in this way they consume less power. This reduction in the consumption of power makes them fuel efficient. Steering column can be attached with both vertical and horizontal steering wheel adjustments. Column assisted electric power steering system are used in compact cars which require small rack force.

Since the motor and ECU are inside the cabin so there is no need of waterproofing and there is no influence on engine and transmission layout. This is the biggest advantage of using electrically powered column drive steering systems. They provide a compact structure and does not require any messy connection like in hydraulic steering systems. They are fuel efficient and are light weight which can be easily installed in an automobile. They have a built in safe technology which allows them to drive the steering manually at the time of system failure.
