Abstracts

Electro hydraulic thrusters are specialized braking and control devices that combine electric motors with hydraulic systems to generate precise linear thrust for industrial applications, primarily used in heavy machinery such as cranes, hoists, and material handling equipment to ensure controlled deceleration and holding of loads. These systems operate by converting electrical energy into hydraulic pressure through a motor-driven pump, which then actuates a piston or ram to apply force, offering advantages like high torque output, reliability in harsh environments, and smooth operation under variable loads. Key components typically include an electric motor, hydraulic pump, cylinder, reservoir, and control valves, with designs varying based on requirements for force, speed, and duty cycle, often customized for specific machinery or safety standards.

The global Electro Hydraulic Thrusters market size was estimated at USD 245.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.50% during the forecast period.
