Abstracts

Electro Optic (EO) crystals are specialized materials that exhibit changes in their optical properties?such as refractive index, birefringence, or polarization state?in response to an applied electric field, enabling the modulation, switching, or manipulation of light in various photonic and optoelectronic applications. These crystals, including widely used types like Lithium Niobate (LiNbO?), Potassium Dideuterium Phosphate (KD*P), and Beta Barium Borate (BBO), are fundamental components in devices such as optical modulators, Q-switches for lasers, frequency converters, and electro-optic sensors, where precise control over light is critical. Their performance is characterized by key parameters like electro-optic coefficients, transparency range, damage threshold, and thermal stability, making them indispensable in industries ranging from telecommunications and defense to medical instrumentation and scientific research.

The global Electro Optic (Eo) Crystals market size was estimated at USD 120.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 6.85% during the forecast period.
