Report Overview

Light propagates at varying speeds dependent on a given material's index of refraction. More specifically, it appears to slow down when it moves from an index of lower refraction like air into a medium with a higher refractive index. If we could somehow modify the the refractive index, we could thus control the propagation of light through a medium. One such phenomenon is the electro-optic effect that allows modifying the refractive index of a medium by subjecting it to an electric field. Electro-optic modulators exploit this effect by sending an electric signal through a medium (typically a crystal) to shift the refractive index and therefore change properties of an incoming light beam.

The Global Electro Optic Modulators EOM Market Size was estimated at USD 390.53 million in 2021 and is projected to reach USD 796.09 million by 2028, exhibiting a CAGR of 10.71% during the forecast period.
