Abstracts

An electro-optic Pockels cell is a high-speed optical device that utilizes the Pockels effect?a linear electro-optic phenomenon in certain non-centrosymmetric crystals?to modulate the phase, polarization, or amplitude of a laser beam in response to an applied electric field. By inducing birefringence proportional to the voltage, it enables precise control over light properties, making it indispensable in applications such as Q-switching for pulsed lasers, optical switching, cavity dumping, and electro-optic modulation across telecommunications, scientific research, medical lasers, and defense systems. Its key advantages include nanosecond response times, high extinction ratios, and minimal absorption losses, distinguishing it from slower alternatives like acousto-optic modulators or mechanical shutters.

The global Electro Optic Pockels Cells market size was estimated at USD 320.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 8.75% during the forecast period.
