Abstracts

An electrocardiograph (ECG or EKG) is a medical device used to record the electrical activity of the heart over a period of time through electrodes placed on the skin, producing a visual output known as an electrocardiogram. It serves as a critical diagnostic tool in cardiology by detecting abnormalities in heart rhythm, identifying signs of coronary artery disease, monitoring the effects of drugs or devices on the heart, and assessing overall cardiac health. Modern ECG systems range from traditional 12-lead hospital-based machines to portable and wearable devices, including handheld monitors and smart patches, which enable both clinical and remote patient monitoring. The core function remains the non-invasive measurement and graphical representation of the heart's electrical impulses, which clinicians use to diagnose conditions such as arrhythmias, myocardial infarctions, and other cardiac pathologies.

The global Electrocardiograph (Ecg) market size was estimated at USD 15652.89 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 5.62% during the forecast period.
