Abstracts

Electroceutical devices, also known as bioelectronic or electrotherapy devices, are medical instruments that use electrical stimulation to modulate neural circuits and treat a wide range of diseases and conditions, representing an emerging intersection of electronics, neuroscience, and medicine. These devices typically function by delivering controlled electrical impulses to targeted nerves or tissues to either restore or alter physiological functions, offering a non-pharmacological alternative or complement to traditional drug-based therapies. Examples include vagus nerve stimulators for epilepsy and depression, spinal cord stimulators for chronic pain, deep brain stimulators for Parkinson's disease, and transcutaneous electrical nerve stimulation (TENS) units for muscle rehabilitation and pain management, with applications expanding into inflammatory disorders, metabolic conditions, and even organ-specific therapies. The core mechanism relies on precise bioelectronic interfacing to influence the body's electrical signaling pathways, aiming for targeted therapeutic outcomes with potentially fewer systemic side effects compared to pharmaceuticals, positioning electroceuticals as a innovative modality in precision medicine.

The global Electroceutical Devices market size was estimated at USD 2850.75 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 8.60% during the forecast period.
