Report Overview:

Electrochemical biosensors are a class of biosensors that function using an electrochemical transducer. They can detect biological materials such as enzymes, whole cells, specific ligands, and tissues, but also nonbiological matrixes.

A number of different types of electrochemical biosensors exist depending on their method for ensuring biological selectivity or their signal transduction method, or a combination of the two. The receptor can be selective for a biocatalytic event such as a reaction that is catalyzed by macromolecules, including enzymes, or for a specific bioaffinity, such as the interaction between an analyte and a macromolecule, independent of their biological environment.

The Global Electrochemical Biosensors Market Size was estimated at USD 5084.79 million in 2023 and is projected to reach USD 8480.87 million by 2029, exhibiting a CAGR of 8.90% during the forecast period.
