Report Overview

Electrochromic Auto Dimming Rearview Mirrors contain two layers of glass and a special gel between them. The gel is electrochromic, meaning it changes color in response to an electrical charge. The mirror detects light via sensors. The sensors are typically a camera or a photodiode, a semiconductor that transforms light into energy. When the ambient light sensors in the mirror detect glare, they release an electrical charge into the mirror's gel. By oxidation-reduction, the gel darkens, minimizing the reflected glare in your rearview. This saves you from glare-related blindness and the resulting blind spot you experience when the car behind you turns off.
