Abstracts

Electrochromic windows, also known as smart windows, are advanced glazing systems that can change their optical properties?such as tint, transparency, or reflectance?in response to an applied electrical voltage, allowing users to dynamically control the amount of light and heat entering a space without the need for traditional window coverings like blinds or shades. These windows typically consist of multiple thin layers, including an electrochromic material (often tungsten oxide), an ion conductor, and an ion storage layer, which together enable reversible coloration and bleaching through the movement of ions and electrons when a low voltage is applied, resulting in energy-efficient modulation of solar gain and glare reduction.

The global Electrochromic Window market size was estimated at USD 1023.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 10.75% during the forecast period.
