Abstracts

Electrode paste, also known as self-baking electrode or Söderberg electrode paste, is a conductive material used in electric arc furnaces for the production of various ferrous and non-ferrous alloys. It is composed of calcined petroleum coke, calcined anthracite, coal tar pitch, and other additives. This paste is introduced into a steel casing, where it undergoes a self-baking process due to the heat generated within the furnace, gradually transforming from a paste into a solid carbon electrode. This process allows the electrode to be continuously consumed and replenished, making it efficient for smelting operations. The electrode paste is available in various shapes, such as cylinders, eggs, and briquettes, to accommodate different furnace designs. It offers excellent thermal and electrical conductivity, high mechanical strength, and resistance to oxidation, which are crucial for maintaining stable furnace operations.

The global Electrode Paste (Self-baking Electrode) market size was estimated at USD 935.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 3.50% during the forecast period.
