Abstracts

An electrode steam humidifier is a type of humidification device that operates by immersing electrodes directly into water, using the conductive properties of the water itself to generate steam through electrical resistance heating; as the mineral content in the water allows current to pass between the electrodes, it heats the water to boiling point, producing clean, sterile steam that is then distributed into the air to increase humidity levels, making it particularly suitable for commercial, industrial, and healthcare applications where precise humidity control, ease of maintenance, and hygienic operation are prioritized, though its efficiency is influenced by water quality and mineral concentration.

The global Electrode Steam Humidifier market size was estimated at USD 215.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.50% during the forecast period.
