Report Overview:

In electrodialysis suspended solids which carry positive or negative electrical charges can increase the resistance of the membrane dramatically, are deposited on the membrane surface. However, in electrodialysis the problem has been eliminated to a large extent by reversing in certain time intervals the polarity of the applied electrical potential which results in a removal of charged particles that have been precipitated on the membranes. This technique is referred to as electrodialysis reversal (EDR).

The Global Electrodialysis Reversal System Market Size was estimated at USD 96.88 million in 2023 and is projected to reach USD 132.08 million by 2029, exhibiting a CAGR of 5.30% during the forecast period.
