Abstracts

An electroencephalogram (EEG) cap is a specialized medical device used to non-invasively record electrical activity from the brain, consisting of an adjustable headpiece embedded with multiple electrodes—often made of Ag/AgCl, gold, or conductive polymer materials—arranged according to standardized systems such as the 10-20 or 10-10 international placements. These caps are designed to ensure consistent electrode positioning, improve signal quality through stable scalp contact (often facilitated by conductive gel or saline solution), and reduce preparation time compared to manual electrode application. They are widely utilized in clinical settings for diagnosing neurological disorders (e.g., epilepsy, sleep disorders), in research for cognitive neuroscience and brain-computer interface studies, and increasingly in consumer neurotechnology applications for biofeedback and mental state monitoring. Modern variants include dry-electrode caps, wireless systems, and high-density arrays, balancing trade-offs between usability, comfort, signal fidelity, and cost to cater to diverse user needs across medical, academic, and commercial domains.

The global Electroencephalogram Caps market size was estimated at USD 315.4 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 6.85% during the forecast period.
