Abstracts

Flip chip bonding is increasingly taking over conventional wire bonding for bonding of microchips, as semiconductor packaging technology advances toward smaller sizes and higher density. Under Bump Metallurgy (UBM) formation to bond metal pads to solder is considered to be essential in flip chip bonding. "UBM" stands for Under Bump Metallurgy (also described as Under Bump Metal or Under Barrier Metal) and is applied to provide solderability to electrodes of semiconductor wafers. UBM is formed by plating wafers or other methods (then UBM is sometimes called as "top metal plating").
