Abstracts

Electroluminescent (EL) lamps are lighting devices that produce light through electroluminescence—a phenomenon where a material emits light in response to an electric current or strong electric field, often involving phosphor-based materials sandwiched between conductive layers. Unlike traditional incandescent or LED lights, EL lamps generate uniform, low-heat, and energy-efficient illumination across their entire surface rather than from a point source, making them suitable for applications requiring even backlighting, flexible form factors, or aesthetic lighting effects. They are commonly used in areas such as instrument panels, safety signage, wearable technology, decorative lighting, and niche consumer electronics where thinness, flexibility, and diffuse lighting are prioritized over high luminosity.

The global Electroluminescent Lamp market size was estimated at USD 115.8 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 3.85% during the forecast period.
