Abstracts

Electroluminescent powder is a phosphorescent material that emits light when subjected to an alternating electric field, functioning through the principle of electroluminescence where electric energy is directly converted into visible light without significant heat generation. Composed of doped semiconductor particles?typically zinc sulfide mixed with copper or manganese?this powder is characterized by its uniform, diffuse glow, flexibility in application, low power consumption, and ability to produce light across various colors depending on the dopants used. It is widely utilized in backlighting, safety signage, decorative lighting, and flexible displays due to its thin-film form factor and even illumination properties.

The global Electroluminescent Powder market size was estimated at USD 385.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 8.25% during the forecast period.
