The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Electrolytic Manganese Dioxide (EMD) competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. Electrolytic manganese dioxide (EMD) is used in Zinc Manganese batteries together with zinc chloride and ammonium chloride. EMD is commonly used in zinc manganese dioxide rechargeable alkaline (Zn RAM) cells also. For these applications, purity is extremely important. EMD is produced in a similar fashion as electrolytic tough pitch (ETP) copper: The manganese dioxide is dissolved in sulfuric acid (sometimes mixed with manganese sulfate) and subjected to a current between two electrodes. The MnO₂ dissolves, enters solution as the sulfate, and is deposited on the anode. In 2024, global Electrolytic Manganese Dioxide (EMD) production reached approximately 460.97 K Tons, with an average global market price of around US\$ 1942 per tons. In 2024, the top three companies by revenue were Xiangtan Electrochemical, South Manganese Investment Limited, and Tosoh. Together, they accounted for 48% of total market revenue in 2024. The global Electrolytic Manganese Dioxide (EMD) market is at a pivotal juncture, characterized by a fundamental transition from a mature industry reliant on primary batteries to a dynamic, growth-oriented sector powered by the lithium-ion revolution. Our analysis concludes that while the market faces significant headwinds in its traditional segment, its long-term trajectory is decidedly positive, driven by powerful, structural trends in energy storage and transportation. Strategic positioning and adaptability will be paramount for industry stakeholders to capitalize on the emerging opportunities. The traditional foundation of the EMD market, primary alkaline batteries, provides a stable but slightly stagnating revenue base. Growth in this segment is largely tied to global population and GDP trends, with limited potential for significant expansion due to competition from rechargeable technologies. Consequently, the

alkaline battery segment will continue to be a high-volume, cost-sensitive business, where operational efficiency and scale are key competitive advantages. The primary engine for future growth is unequivocally the lithium-ion battery industry. EMD serves as the essential precursor for lithium manganese oxide (LMO) cathode chemistry, which is gaining considerable traction due to its superior safety, power output, and cost-effectiveness compared to other lithium-based chemistries. The proliferation of LMO batteries in electric two-wheelers, power tools, and increasingly in grid-scale energy storage and entry-level electric vehicles, is creating a new, high-value demand stream for EMD. This "lithium-ion grade" EMD commands a significant price premium due to its stringent technical specifications, requiring ultra-high purity and tightly controlled physical properties, thereby creating a more profitable market segment for qualified producers. The competitive landscape is consequently evolving. The market is bifurcating between large-scale producers serving the cost-sensitive alkaline market and specialized, often integrated, players focusing on the high-performance lithium-ion segment. Technological capability and the ability to consistently produce high-purity EMD are becoming the new barriers to entry and key differentiators. Furthermore, the industry's geographic center of gravity continues to shift towards the Asia-Pacific region, which boasts not only the world's largest battery manufacturing ecosystem but also competitive production costs. Looking ahead, the EMD market is projected to experience a steady and robust Compound Annual Growth Rate (CAGR), potentially in the high single digits, over the next five to ten years. This growth will be fueled by the continued, albeit slow, expansion of the alkaline battery market and the accelerated adoption of LMO batteries. However, this optimistic outlook is tempered by challenges, including volatile raw material costs, intense competition from other cathode chemistries like LFP and NMC, and increasing environmental compliance costs. In conclusion, the EMD industry is undergoing a necessary and transformative evolution. Success for market participants will hinge on their ability to navigate this dual-market reality: maintaining competitiveness in the traditional sector while strategically investing in the R&D, production capabilities, and partnerships required to thrive in the high-growth, value-added lithium-ion battery supply chain. The future belongs to those who can adapt to this new paradigm.

The global Electrolytic Manganese Dioxide (EMD) market size was estimated at USD 895.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.40% during the forecast period.
