Abstracts

Electro-zinc anode plate is a core anode material used in the electro-zinc process. It is often used in the zinc electrolysis process to deposit zinc onto the cathode through electrochemical reaction to extract pure zinc. Electro-zinc anode plates usually use titanium as the substrate, and the surface is coated with an active catalytic coating to improve electrochemical efficiency and corrosion resistance. Its structural design usually includes a titanium substrate and a special active coating, which has good conductivity, durability and stability. In the electro-zinc process, the main function of the anode plate is to serve as a conductive source of current and to stably release zinc ions in the electrolyte. Since its working environment contains corrosive media such as sulfuric acid, the corrosion resistance of the anode plate is required to be high. The life and efficiency of the anode plate directly affect the production cost and quality of electro-zinc, so modern electro-zinc anode plates mostly use more durable titanium substrates and special electrochemical active coatings to extend their service life.

The global Electrolytic Zinc Anode Plate market size was estimated at USD 12260.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 3.20% during the forecast period.
