Abstracts

Electromagnetic flow proportional valve is a kind of hydraulic valve that converts the input electrical signal into force or displacement in proportion, so as to continuously control parameters such as pressure and flow. Proportional valve is composed of DC proportional electromagnet and hydraulic valve. The hydraulic valve part is not much different from the general hydraulic valve, but the DC proportional electromagnet is different from the electromagnet used in the general solenoid valve. The displacement output and suction output proportional to the given current can be obtained by using the proportional electromagnet.

The global Electromagnetic Flow Proportional Valve market size was estimated at USD 385.5 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.85% during the forecast period.
