Abstracts

An electromagnetic heat meter is a specialized flow measurement device that utilizes Faraday's law of electromagnetic induction to determine the volumetric flow rate of conductive fluids, such as water or glycol mixtures, within closed-loop heating or cooling systems; it integrates temperature sensors at the inlet and outlet to calculate thermal energy consumption by measuring the temperature difference and combining it with flow data, providing highly accurate and reliable billing or monitoring for district heating, building management, and industrial process applications where minimal pressure loss, resistance to fouling, and long-term stability are critical advantages over mechanical meters.
