Abstracts

The electromagnetic wave wireless measurement while drilling instrument is a wireless transmission device used to monitor downhole parameters in real time during oil and gas drilling. Its core principle is to use electromagnetic waves as a carrier to transmit the drill bit position, well inclination, formation parameters, temperature and pressure data collected by the bottom hole sensor to the ground system through the formation or drill string, without relying on traditional mud pulse or cable communication. Compared with wired drilling and mud pulse technology, electromagnetic wave wireless transmission has the advantages of strong anti-interference, adaptability to deep wells/ultra-deep wells, and complex formations. It is a key technology for achieving efficient directional drilling and geological guidance.

The global Electromagnetic Wave Wireless Measuring Instrument While Drilling market size was estimated at USD 238.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.20% during the forecast period.
