Report Overview

An electromechanical relay uses a physical moving part to connect contacts within the output component of the relay. The movement of this contact is generated using electromagnetic forces from the low-power input signal, allowing the completion of the circuit that contains the high-power signal. The physical component within the electromechanical relay commonly makes a “click” sound, which can actually be useful in some situations, though it can lead to internal arcing and takes a relatively large amount of time to move.

Electromechanical relays are switches that control high power electrical devices by using a small amount of power. Rising global energy prices is driving the demand for advanced electromechanical relays to reduce power consumption. Rising number of renewable energy projects is also fuelling the demand for high capacity electromechanical relays, thus positively impacting the growth of global EMR market. However, advancements in semiconductor fabrication and manufacturing technology has led to the emergence of solid-state relays (SSRs) which hampers the growth of EMR market during the projected period.
