Abstracts

An electromyogram (EMG) monitoring system is a medical diagnostic device used to assess and record the electrical activity produced by skeletal muscles, typically through the insertion of fine needle electrodes into muscle tissue or the use of surface electrodes placed on the skin. These systems capture, amplify, and display electrical signals generated during muscle contraction and at rest, enabling clinicians to evaluate neuromuscular function, detect abnormalities such as neuropathy, myopathy, or nerve compression, and monitor the progression of neurological disorders or the effectiveness of treatments. Advanced EMG systems often integrate with nerve conduction studies and may include software for signal analysis, data storage, and report generation, supporting applications in neurology, physical medicine, rehabilitation, sports medicine, and research.

The global Electromyogram Monitoring market size was estimated at USD 463.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 7.85% during the forecast period.
