Abstracts

Electron beam curable ink is a specialized type of radiation-curable ink that utilizes high-energy electron beams (EB) to initiate polymerization, resulting in instantaneous curing without the need for photoinitiators or heat. This technology is primarily used in industrial printing applications, such as packaging, labels, and flexible materials, where it offers advantages including high chemical resistance, low volatile organic compound (VOC) emissions, and the ability to cure opaque or thick ink layers that UV light cannot penetrate. The formulation typically consists of oligomers, monomers, and pigments, which cross-link upon exposure to electron beams, creating a durable and environmentally stable print.

The global Electron Beam Curable Ink market size was estimated at USD 715.2 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 8.50% during the forecast period.
