Abstracts

Electron Beam Curing (EBC) is a type of radiation curing technology. High-energy electron beams directly interact with the system to be cured to cause polymerization, grafting or cross-linking reactions, thereby curing the material. The electron beam (EB) curing process generates less heat than UV and LED curing, providing a more complete cure with virtually no odor. EB units use up to 95% less energy than thermal drying and up to 80% less energy than UV curing. The electron beam curing market is experiencing steady growth, driven by increasing demand for high-performance and environmentally friendly curing technologies across various industries. This process, which uses high-energy electrons to initiate polymerization and hardening of materials, offers several advantages over traditional thermal and UV curing methods, including faster processing times, lower energy consumption, and the ability to cure thick or pigmented coatings without the need for additional photoinitiators. Industries such as automotive, aerospace, packaging, and electronics are adopting electron beam curing to enhance product durability and production efficiency. Technological advancements in electron beam equipment and the push toward sustainable manufacturing practices are also fueling market expansion. However, high initial investment costs and the need for specialized operating conditions pose challenges to wider adoption. Despite these barriers, ongoing innovation and the growing emphasis on eco-friendly solutions are expected to support continued growth in the electron beam curing sector.

The global Electron Beam Curing (EBC) market size was estimated at USD 1713.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.10% during the forecast period.
