### Report Overview

Electron beam defect inspection equipment is a technical equipment used to detect surface and internal defects of materials or products. It uses the electron beam as a detection tool, and can find and identify various defects, such as cracks, holes, bubbles, inclusions, etc., by scanning and analyzing the sample to be tested. This equipment usually consists of the following main parts: Electron Beam Emitter: Generates a beam of high-energy electrons, usually through an electron gun or source. Scanning system: controls the movement of the electron beam on the surface of the sample to be tested, usually using an electron beam scanning coil or an electron beam lens. Detector: Used to measure the response of the electron beam to the sample after it interacts, usually by detecting reflected, scattered or transmitted electrons. Data processing and display system: used to receive, process and display detected signals and images, usually including a computer and related software. It has the advantages of high resolution, non-contact detection, fast scanning and high sensitivity, which can help detect and evaluate the quality and reliability of materials and products.
