Report Overview

In electron energy loss spectroscopy (EELS) a material is exposed to a beam of electrons with a known, narrow range of kinetic energies. Some of the electrons will undergo inelastic scattering, which means that they lose energy and have their paths slightly and randomly deflected. The amount of energy loss can be measured via an electron spectrometer and interpreted in terms of what caused the energy loss.

The global Electron Energy Loss Spectroscopy (Eels) market size was estimated at USD 145.8 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 6.85% during the forecast period.
