Abstracts

Electron transport materials (ETMs) are a class of organic or inorganic semiconductors used in optoelectronic devices?most notably in organic light-emitting diodes (OLEDs), perovskite solar cells, and organic photovoltaics?to facilitate the efficient movement of electrons from the cathode to the active light-emitting or light-absorbing layer while blocking holes to prevent recombination losses. These materials are characterized by high electron mobility, suitable energy level alignment with adjacent layers, good thermal and morphological stability, and often low manufacturing complexity. Key examples include small molecules like tris(8-hydroxyquinolinato)aluminium (Alq3), metal oxides such as zinc oxide (ZnO) and titanium dioxide (TiO?), and emerging polymeric or non-fullerene acceptors designed to enhance device efficiency, longevity, and commercial viability.

The global Electron Transport Materials market size was estimated at USD 2150.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 15.50% during the forecast period.
