## Abstracts

The electronic bionic eye, also known as a retinal prosthesis or visual prosthesis, is a neurostimulation device designed to restore partial vision in individuals with severe retinal degenerative diseases such as retinitis pigmentosa or age-related macular degeneration. It operates by converting visual information from an external camera into electrical signals that stimulate remaining functional retinal cells or the visual cortex, bypassing damaged photoreceptors to create artificial visual perception in the form of light patterns, shapes, or motion. These systems typically consist of an external unit (e.g., glasses-mounted camera and processor) and an implanted electrode array, aiming to provide users with improved spatial orientation, object detection, and greater independence in daily activities.

The global Electronic Bionic Eye market size was estimated at USD 15.7 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 18.50% during the forecast period.
