## Abstracts

Electronic crosslinked polyethylene foam is a high-performance foam material made by cross-linking polyethylene materials through electron beam irradiation technology. It adopts physical cross-linking method, through the irradiation of high-energy electron beams, the polyethylene molecules form a three-dimensional network structure, thereby improving the physical and thermal properties of the material. Compared with chemical cross-linked foam, the advantage of electronic cross-linking is that its cross-linking process is more uniform and environmentally friendly, and no chemical cross-linking agent is required, avoiding chemical residues. Due to its uniform closed-cell structure, the material exhibits excellent compression resistance, tear resistance and low water absorption performance, and has good thermal insulation and cushioning properties. This foam has a wide adjustable density range, is lightweight and flexible, can withstand temperature changes of up to 100°C, and has excellent weather resistance, making it suitable for long-term use in complex environments. It meets environmental protection requirements, is non-toxic and odorless, and can meet the strict requirements of different industrial fields for material safety.

The global Electronic Crosslinked Polyethylene Foam market size was estimated at USD 483.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.70% during the forecast period.
