Abstracts

An electronic emergency ballast is a specialized device integrated into fluorescent or HID lighting systems that provides backup power during electrical outages, ensuring continuous illumination for a predetermined period, typically 90 minutes to 3 hours, by converting stored energy from an internal battery to power the lamp(s). Unlike traditional magnetic emergency ballasts, electronic versions utilize solid-state components for higher efficiency, reduced size, quieter operation, and improved compatibility with modern lamps, while often incorporating features such as self-testing, diagnostics, and monitoring to comply with safety regulations like NFPA 101 Life Safety Code and UL 924 standards. These devices are critical in applications where maintained lighting is essential for safety and egress, such as in commercial buildings, hospitals, schools, and industrial facilities, serving both as a power conversion unit and an emergency lighting controller by automatically activating upon main power failure and reverting to standby mode once utility power is restored.

The global Electronic Emergency Ballast market size was estimated at USD 426.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.15% during the forecast period.
