Report Overview

Electronic Expansion Valves (EEV) are used in a range of refrigeration systems such as commercial cool rooms and walk-in freezers to precisely control the flow of refrigerant into the evaporator. They are an evolution of conventional Thermostatic Expansion Valves (TEV) that use springs, bellows and pushrods to control the amount of refrigerant released into the evaporator and hold a constant evaporator superheat. The EEV is a more sophisticated design and operates with greater precision and efficiency. EEVs control the flow of refrigerant entering a direct expansion evaporator in response to signals sent by an electronic controller. This allows the refrigeration system to operate much more accurately and efficiently.
