## Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Electronic Glass Fiber for Automotive Industry competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. Automotive electronic glass fiber is a functional material made from ultrafine electronic-grade glass fiber yarn, specially woven and surface-treated to provide insulation, heat resistance, and high strength. It is primarily used in automotive electronic control systems (such as ECU substrates), new energy battery packs (BMS circuit boards), smart driving sensors (radar/camera PCBs), and lightweight body structural components (carbon fiber-glass fiber hybrid reinforcements). Global automotive electronic glass fiber sales are expected to reach 600,000 tons in 2024, with an average selling price of approximately US\$800 per ton. The upstream process uses mineral raw materials such as quartz sand and pyrophyllite, which are drawn into electronic yarn using a tank kiln. The midstream process encompasses weaving (plain weave using air-jet looms), fiber opening (high-pressure water jet single-fiber separation), post-processing (silane coupling agent impregnation), and micro-impurity control (metal impurities at the ppm level), achieving industry-leading yield rates. The downstream process forms a comprehensive supply chain from electronic yarn to copper-clad laminate (CCL) to automotive electronic PCBs (PCBs) and end-use applications.

The global Electronic Glass Fiber for Automotive Industry market size was estimated at USD 480.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.60% during the forecast period.
