Abstracts

An electronic ignition module is a solid-state electronic device that replaces the mechanical points and condenser in a traditional ignition system, functioning as the primary control unit responsible for precisely timing and delivering high-voltage electrical pulses to the spark plugs to initiate combustion in an internal combustion engine. It typically integrates components such as a magnetic pickup, Hall-effect sensor, or optical sensor to monitor crankshaft or distributor position, processes this input through internal circuitry to determine optimal spark timing based on engine speed and load, and then triggers the ignition coil to generate the necessary high voltage, thereby improving engine efficiency, reliability, and emissions performance compared to conventional contact-point systems.

The global Electronic Ignition Module market size was estimated at USD 1650.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 6.50% during the forecast period.
