Report Overview

Since the heat sink material needs to be closely attached to the chip, two basic performance requirements need to be considered: high thermal conductivity (TC) and matching coefficient of thermal expansion (CTE). High thermal conductivity realizes rapid heat dissipation to ensure that the chip works normally at a suitable temperature; through the matching thermal expansion coefficient, it reduces the thermal stress between the heat sink, the chip and the packaging materials, and avoids cracking and detachment that may cause the chip to overburn occur. The essence of the upgrade and development of heat sink materials is the process of continuous optimization of thermal conductivity and thermal expansion coefficient. There are two main categories of electronic packaging heat sinks, ceramics and metals.
