Abstracts

Electronic radiator thermostat is an electronic device used to intelligently control the temperature of heat dissipation equipment (such as CPU, LED, electric vehicle battery, etc.). It monitors and adjusts the heat dissipation power in real time through temperature sensors to ensure that the equipment operates within the optimal temperature range. Its core components include temperature control chips (such as PID controllers), thermocouples/thermistors, relays or PWM speed control modules, and some high-end products support Wi-Fi/Bluetooth remote control. It is suitable for computers, new energy vehicles, industrial automation and smart home fields, with high precision ($\pm 0.5^\circ\text{C}$), low energy consumption (
