Abstracts

A typical suspension structure is composed of elastic elements, guide mechanisms, shock absorbers, etc., and individual structures also have buffer blocks, stabilizer bars, etc. Elastic elements are in the form of leaf springs, air springs, coil springs, and torsion bar springs. Modern car suspensions mostly use coil springs and torsion bar springs, and some high-end cars use air springs. The elastic element is mainly used to bear the vertical force and convert it into elastic potential energy, so as to reduce the impact caused by the car running on the uneven road. Electronic control-by-wire suspension components are an innovative technology closely related to market trends in the automotive industry. With the continuous advancement of automotive technology, consumers' demands for driving experience and safety continue to increase, which has promoted the widespread application of electronic suspension systems. Traditional mechanical suspension systems no longer meet market demand, and electronic control-by-wire suspension components provide a brand-new solution to this demand. Electronic ride-by-wire suspension elements use advanced electronic sensors and control units to adjust suspension stiffness and height by monitoring road conditions and vehicle dynamics in real time. This intelligent suspension system can provide a smoother driving experience, improve vehicle handling performance, and increase driving safety. In addition, electronic control-by-wire suspension elements automatically adjust to the driving mode and road conditions, providing greater driving comfort and fuel efficiency.

The global Electronic Suspension-by-wire Element market size was estimated at USD 1749.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.10% during the forecast period.
