Abstracts

An electronic torque limiter is a mechanical device that uses electronic technology to precisely control and limit torque. It is usually installed in a power transmission system, such as between a motor and a reducer or on a drive shaft. This device is equipped with a built-in torque sensor that can monitor the torque in the system in real-time and transmit the monitored torque signal to the electronic control system. When the detected torque exceeds the pre-set limit value, the electronic control system will respond promptly. It can cut off or adjust the power transmission in a timely manner by controlling the separation of the clutch or adjusting the output power of the motor, thereby preventing equipment damage due to overloading and ensuring the safe and stable operation of the entire transmission system. The electronic torque limiter has the advantages of fast response speed, high control accuracy, and flexible setting of torque limit values, and is widely used in industrial fields with high requirements for torque control, such as machine tools, automated production lines, and robots.

The global Electronic Torque Limiter market size was estimated at USD 74.7 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 79.00% during the forecast period.
