Abstracts

An electronically commutated inner rotor is a type of motor component. In this design, the rotor is located inside the stator. The commutation, which is the process of changing the direction of current in the motor windings to ensure continuous rotation, is achieved electronically rather than through traditional mechanical means like brushes. The electronic control system precisely manages the current supplied to the stator windings, which in turn generates a magnetic field that interacts with the magnets on the inner rotor. This interaction causes the inner rotor to rotate. Electronically commutated inner rotors are known for their high efficiency, quiet operation, and precise speed control capabilities. They are widely used in various applications such as ventilation systems, air conditioning units, and some precision machinery where reliable and efficient motor performance is required.

The global Electronically Commutated Inner Rotor market size was estimated at USD 989.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.30% during the forecast period.
