## Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Electrophoresis Loading Buffer competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. SDS can bind to proteins and make the protein-SDS complex carry a large amount of negative charge. At this time, the charge of the protein itself is completely covered by SDS, eliminating the difference in the charge of various proteins. SDS can also break the hydrogen bonds within and between molecules, destroy the secondary and tertiary structures of protein molecules, and DTT can break the disulfide bonds between cysteine residues, destroy the spatial structure of proteins, and eliminate the differences between protein structures. Therefore, the electrophoresis speed is only related to its molecular weight. Bromophenol blue is used as an indicator during electrophoresis, which can roughly indicate the time when electrophoresis ends.

The global Electrophoresis Loading Buffer market size was estimated at USD 255.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.00% during the forecast period.

This report offers a comprehensive and in-depth analysis of the global Electrophoresis Loading Buffer market, covering all critical facets from a broad macroeconomic overview to detailed micro-level insights.
