Report Overview

Electrophotographic printing is one of the oldest printing technologies. It is also known as xerography or laser printing. It utilizes electrophotographic papers that are capable to withstand heat and toner formulations used in the electrophotographic printing process. The type of paper used depends on the type of electrophotographic printing such as laser printing. The electrophotographic paper used in laser printing needs to withstand high heat involved in the printing process and is required to possess anti-jamming and anti-curling properties. The paper performance is also affected by the paper path of the printing equipment. The papers undergo surface treatment for better printing, low color mottle, and reduced feathering. The surface treatment process reduces the drop penetration depth in the printing paper and brightens its colors. Electrophotographic printing papers can be coated or uncoated. Uncoated papers are used widely as desktop or office printing papers. These papers are often coated with a heavy mineral coating, which enhances the quality of the paper surface. Coated papers are widely used for printing of images, brochures, and booklets.

The global Electrophotographic Printing Paper market size was estimated at USD 3126 million in 2023 and is projected to reach USD 4975.59 million by 2032, exhibiting a CAGR of 5.30% during the forecast period.

North America Electrophotographic Printing Paper market size was estimated at USD 890.23 million in 2023, at a CAGR of 4.54% during the forecast period of 2024 through 2032.
